Wiring diagram

Functional principle

The measuring principle of inductive angle sensors is based on oscillation circuit coupling between the positioning element and the sensor. The output signal provided is proportional to the angle of the positioning element. The rugged sensors are wear and maintenance-free, thanks to the contactless operating principle. They convince through their excellent repeatability, resolution and linearity within a broad temperature range. Thanks to the innovative technology, electromagnetic AC and DC fields have no influence on the measured signal.

Mounting instructions / Description

A broad range of accessories allows the device to be mounted in many different ways. Based on the functional principle of RLC coupling, the sensor is immune to magnetized metal splinters and other interferences.

LED indications:

green steady:

Positioning element is in the measuring range

yellow steady:

Positioning element has reached the end of the measuring range. This is indicated by a lower signal quality, see status bit 22.

yellow flashing:

Positioning element is outside the coverage, see status bit 23

off:

Positioning element is outside the programmed measuring range (only with teachable versions)
