Wiring diagram

Functional principle

The measuring principle of inductive angle sensors is based on oscillation circuit coupling between the positioning element and the sensor. The output signal provided is proportional to the angle of the positioning element. The rugged sensors are wear and maintenance-free, thanks to the contactless operating principle. They convince through their excellent repeatability, resolution and linearity within a broad temperature range. Thanks to the innovative technology, electromagnetic AC and DC fields have no influence on the measured signal.

Mounting instructions / Description

A large selection of accessories provide multiple mounting possibilities. Due to the measuring principle based on oscillating circuit coupling, the linear position sensor is immune to magnetized metal splinters and other interferences.

Measuring range displayed via LED:

green:

Positioning element is in the measuring range

yellow:

Positioning element is in the measuring range, lower signal quality (e.g. distance too large)

yellow flashing:

Positioning element is outside the measuring range

off:

Positioning element is outside the programmed measuring range (only with teachable versions)

Teaching mode

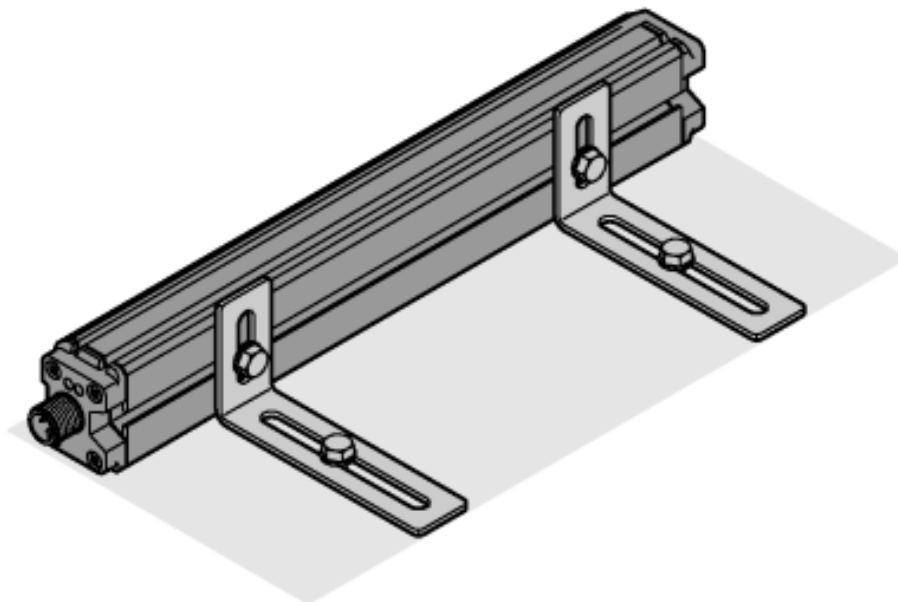

At a push of a button, the start and end value of the measuring range is adjusted with the teach adapter. Moreover the output curve can be inverted.

10 sec. jumper between pin 5 and pin 1= factory setting

10 sec. jumper between pin 5 and pin 3= factory setting inverted

2 sec. jumper between pin 5 and pin 3 = measuring range - start value

2 sec. jumper between pin 5 and pin 1 = measuring range - end value
