Wiring diagram

Functional principle

The measuring principle of inductive angle sensors is based on oscillation circuit coupling between the positioning element and the sensor. The output signal provided is proportional to the angle of the positioning element. The rugged sensors are wear and maintenance-free, thanks to the contactless operating principle. They convince through their excellent repeatability, resolution and linearity within a broad temperature range. Thanks to the innovative technology, electromagnetic AC and DC fields have no influence on the measured signal.

Mounting instructions / Description

A broad range of accessories allows the device to be mounted in many different ways.

The positioning element can be mounted offset by 90°. This provides highest mounting flexibility. The linear position sensor can also be mounted offset by 90° with the two provided fittings. Based on the functional principle of RLC coupling, the sensor is immune to magnetized metal splinters and other interferences.

LED indications:

green steady:

Positioning element is in the measuring range

green flashing:

Positioning element has reached the end of the measuring range. This is indicated by a weaker signal.

off:

Positioning element is outside the coverage.

TEACH process

The start and end value of the measuring range are set via teach adapter at the touch of a button. Moreover the output curve can be inverted.

Bridge pin 5 and pin 1 for 10 s = factory setting

Bridge pin 5 and pin 3 for 10 s = factory setting inverted

Bridge pin 5 and pin 3 for 2 s = sets start value of measuring range

Bridge pin 5 and pin 1 for 2 s = sets end value of measuring range
