Mounting instructions

Mounting instructions/Description

There are two different mounting options. One option is to position the positioning element above the sensor housing. However, it can also be mounted so that the sensor housing completely encloses the positioning element.

LED function

Operating voltage

Green: Power on

Displayed measuring range

Green: Positioning element is in the detection range

Green flashing: Positioning element is within the measuring range, low signal intensity (e.g. distance too large)

Off: Positioning element is outside the detection range

Inductive measuring principle provides more safety
 Due to the measuring principle, which is based on the functional principle of an RLC coupling, the sensor operates absolutely wear-free and is immune to magnetized ironware and other interferences. The amplitude of the signal can be changed by metal parts, which in turn affects the accuracy.
 Owing to the differential analysis, the output signal remains almost unchanged, even if the position of the positioning element deviates from the ideal axis of rotation. The distance between the sensor and the positioning element can be up to 5 mm, whereby the nominal distance is 1 mm.
